**NEW RELEASE**

## A GRAND STRATEGIC ADVENTURE

# Russia

## The Great War in the East 1941-1945

*Russia, The Great War in the East 1941-45*, is a recreation of the climactic four years of bitter conflict which raged from the warm shores of the Black Sea to the frozen tundra of the Arctic Circle.

Using the simple, yet sophisticated, menu structures for which we are famous, the enormous complexity of this epic struggle is reduced to an elegant, easy-to-use order routine.

Two levels of command are provided for. You may assume supreme command of all your forces by taking control of OKH (Germany) or Stavka

(Russia). Or you may elect to command one or more Army Groups (Germany) or Theatres (Russia).

Or you can command everything. Or nothing! Just sit back and watch the battle unfold before your eyes as your computer plays out the greatest clash of arms in human history.

In addition to the four year campaign scenario, the inclusion of our ubiquitous design kit allows you to vary both economic and military parameters, begin the campaign at any point in the struggle

or create a multitude of short battle scenarios using only a portion of the game map. These short scenarios, of which two are included with the game, involve a single Army Group (Theatre) and omit the strategic interphase which occurs every month (i.e. every four turns). They can be played to a conclusion in 1 to 2 hours.

For the keen historical gamer as well as the novice *Russia* will provide a lifetime of satisfying entertainment.

**Look for it soon. For the Apple II Family and the C-64/128. Just \$40.**

# BATTLEFRONT

**NOW AVAILABLE**

## IS A RECREATION OF LAND BATTLES FROM THE SECOND WORLD WAR

Four separate scenarios are included with the game system as well as a comprehensive and easy-to-use design kit. The scenarios are Crete (1941), Stalingrad (1942), Saipan (1944) and Bastogne (1944).

Each commander can control a force as large as an army corps; up to 60 battalions distributed in 3 divisions. The computer can direct either or both commands, allowing for an exciting face-to-face contest with a friend, challenging solitaire play and/or extensive historical analysis.

A complete range of unit types is provided including among others, infantry (foot, motorized and mechanized), armour, anti-tank, artillery, engineer, parachute and marine battalions.

The game mechanics will simulate meeting engagements, mobile defense operations, set-piece assaults, amphibious and airborne invasions in any combination.

Unit strengths and types, types and difficulty of terrain, effects of roads, cities and forts are all software controllable. A complete and accurate battle environment can be built up to recreate each scenario.

Off-board air and naval support, air superiority, weather, supply, fatigue and combat experience are all included.

Your role as the corps commander is to direct the divisional and regimental HQs of your force by assigning an order from the appropriate action menu. The actual movement of battalions and the resolution of any conflict is handled by the computer.

The strategic and tactical decision making is up to you. How well your men execute your orders will be a true test of how well you have commanded them.

**For the Apple II Family and the C-64/128. Just \$40.**

## EDITOR'S CHANCE

Well, there's been a bit of a mistake this issue. I don't have room for several of our regular features, namely letters, questions and answers and work in progress. As I'm sure you all realize, it wasn't my fault. That Roger waxed garrulous this issue and turned out a six page article instead of his usual three.

Normally I can edit an article to fit but in this case, since I barely understand any of it, I thought it might be a bit dangerous to mess around. I mean, something vital could get left out.

The programming techniques behind computer game design are fascinating in their own right and just as deserving of care as the historical models they are built to simulate. I keep a pretty close eye on strategy software from other publishers and it's my experience that there are very few games out there which avail themselves of the sort of tool Roger has explained in this issue; much to their detriment.

I expect to talk a bit more on the inter-relationships between programming and game design in the next issue. It's an interesting topic.

This issue is going to press three weeks earlier than scheduled (it was either that or two weeks late) and, among other omissions, we have not completed judging in the *Europe Ablaze* contest. We'll do that shortly and notify the winner in January. The winning scenario will still be published in our next issue.

Speaking of contests, have a look at the last issue for the details of our *Battlefront* contest. The deadline for entries is June 30th, 1987. As an aside, we have received a dozen entries already, including a simulation of the battle of Gettysburg!

Danny Stevens has joined the company and is presently working on Macintosh conversions of our games. We hope IBM and other formats will follow.

*Russia* is scheduled for release on January 20th and appears on target! It's our best game to date and you can take my word for it that the \$40 it will cost you is money very well spent. *Road to Appomattox* will hopefully be ready in time for Origins '87, which is just about three years on from the time we first announced our intention of

## SUBSCRIPTION RATES

(4 issues/1 year)

### IN AUSTRALIA

Magazine/disk sub. = \$AUD 65.00

Magazine only sub. = \$AUD 15.00

### IN NORTH AMERICA

Magazine/disk sub. = \$USD 65.00

Magazine only sub. = \$USD 15.00

### ELSEWHERE

(Surface Post)

Magazine/disk sub. = \$AUD 75.00

Magazine only sub. = \$AUD 25.00

(Airmail Post)

Magazine/disk sub. = \$AUD 85.00

Magazine only sub. = \$AUD 35.00

To subscribe, consult the schedule of fees above and make sure you include your computer type (Apple or C-64) with your cheque or money order if you want a disk subscription. A disk subscription entitles you to however many disks are necessary to complement all the scenarios in the magazine.

For those of you who don't want to spend this extra money. . . don't worry. All the data necessary to build the magazine scenarios will be provided for you.

North American subscribers should send a cheque or money order (in US funds) to our US office. Everyone else should send their cheque, money-order, Visa or Mastercard to our Australian office.

Individual scenario disks can be purchased for \$15.00 each.

doing the game. Well, patience is its own reward and you can be sure that if by some cruel stroke of fate we are delayed further, it won't simply be to develop character in our customers.

**This time we've got it right. . .** Notwithstanding anything we've said to the contrary in previous issues, the correct version numbers for *Carriers at War* are 1.2 for the C-64 format and 1.1 for the Apple format. Phew! ◆

# DESIGN HINTS FOR BATTLEFRONT

*Designing a scenario is an activity with much to recommend it. It is your chance to simulate a part of history. The research, design and system manipulation are all interesting and rewarding tasks. We would wish to encourage as many people as possible to try their hand. It is really not as difficult as you might think.*

It was not possible to include a detailed design treatment in the original *Battlefront* manual. (We ran out of time, Ed.) This article is meant to expand upon the manual, and will attempt to explain the essential aspects of design in more detail.

The first question to be addressed is that of absolutes. *Battlefront*, like any game system, is itself an abstraction of reality. It defines a structure into which scenario information must be fitted. You should not be too concerned about the manipulations of your source information which may be necessary to do this. Your sources themselves may be once or several times removed from reality, and a common sense approach will serve you best.

## TERRAIN, MOVEMENT AND MAP CREATION.

This is actually a lot easier than it seems. The terrain in *Battlefront* is not as important as the number and quality of the troops defending. Exploiting the terrain setup is very difficult where you can't totally control your troops. Obviously, the basic terrain features should closely reflect the original and movement and combat values chosen as appropriate. There are no real rules for these values, as they depend so heavily on the type of troops present.

One area where care must be taken is in cooperating with the computer. Rivers and their crossing can present a problem. The river hexsides as defined in the game prevent movement by any mechanised unit except at bridge hexsides. Remember mechanised movement is not dependent on unit type, all units with a movement allowance greater than a specified minimum value, the 'MECH-MIN' use mechanised movement.

Roger's generalised movement routines are very good at finding their way unaided, but occasionally they can be tricked. Beware of little cul-de-sacs which suck units in and are hard to get out of. Block them off with river hex-sides, make them prohibited (zero movement point) terrain or provide a bridge out as appropriate. Sometimes the routines appreciate more than one bridge exit from a hex, don't be shy about providing it.

Sometimes a river may not be necessary. If units crossed it without any trouble, it may be better to just leave it out. Alternatively, strategically located rivers do an excellent job of channeling the advance of mechanised troops.

At other times you may not want anyone at all to cross a river, except at a bridge. In this case make a one hex wide river, using ocean (T0) terrain. Define a terrain type called 'BRIDGE' or whatever, with low movement costs, (it will probably be part of a road anyway), and place this type where you want the bridge(s). Crossing rivers is also important for supply. All HQ's use the 'MECH-MIN' value for movement and must be able to trace a mechanised supply path to their troops to create a line of supply.

The adjacent controlled hex penalty regulates how quickly your lead units will move through enemy controlled territory. This should be related to troop density and ease of control over the terrain.

## UNIT CREATION

This is probably the hardest part of scenario design. Exact unit formations and strengths are often hard to come by. Boardgames, even if they don't cover the scenario exactly are

often useful. Future *Run 5's* will also publish templates for the more common unit organisations. (There would have been some in this issue but we ran out of room, Ed.)

The critical part of unit creation is getting the structure right. As an example let us consider the different armoured divisions in the Bastogne scenario. The Americans have neatly divided theirs into three Combat Commands, each of which consists of one battalion each of tanks, mechanised infantry and self propelled artillery. The recon and engineer units along with the divisional artillery are left as divisional assets.

The German structure is quite different. In the 2nd Panzer XX, only one panzer grenadier regiment is mechanised, the other guys only get trucks. Assault guns (Stug III's) substitute for real tanks. The only real tanks, one battalion of Mk IV's and one of Mk V's are created as divisional assets. This arrangement gives a vital flexibility that makes up for a lot of shortcomings in actual equipment levels.

Obviously, the divisional assets are critical to a formation. Artillery should usually be an asset so all regiments can benefit. So should elite or special troops that can really make a difference in the battle.

The other values, like strength and rating, are relative, but the average strength of an infantry battalion would be between 9 and 11 and its rating around 9. These values are pretty standard but there are often good reasons to vary them. Airborne troops should get a lower rating simply because they can't carry everything they need with them. Elite units usually get more of everything. Garrison troops, militia, penal battalions or the dreaded Guadalcanal airfield construction troops are often lucky to have anything more than military picks.

The experience factor should be allocated with care. Remember, each word represents two numbers. Elite (7) troops can take horrific casualties (up to 80% on occasions) before they rout, and they recover quite quickly. They are also deadly in minor combat. Green (0) men can't even sleep without a light on. Very few troops were ever this bad. Even the Cons Bde on Guadalcanal, who were basically ditch diggers, rated a (1). Try to avoid the temptation to create one army of supermen, fighting another of devout pacifists.

The HQ factors are critical to the outcome of a scenario. An army of supermen are useless without bullets. The entire character of the

Guadalcanal scenario is determined by the Japanese Divisional Supply and Admin values which are exceptionally low. These values severely restrict the offensive capabilities of the more numerous and experienced Japanese who would otherwise probably push the Americans into the sea. Try it and see for yourself.

## COMBAT

The combat routines in *Battlefront* embody the affect of supporting arms and combined arms. Bonuses are given in combat for the presence of supporting arms in the shape of artillery, off board support or heavy weapons capacity (any unit with a range greater than zero). Similarly a combined arms bonus is given for the presence of armour type units.

The presence of armour units, regardless of strength or ratings will have a definite bonus. These should always be disposed to give maximum flexibility. Similarly, the mere presence of artillery or OBS points makes a substantial difference to a combat. Since designation of divisional artillery as a battalion is probably an arbitrary matter, it is preferable, if there is the room, to create two artillery units rather than one. This again gives more flexibility, although this extra flexibility may not always be warranted, or possible.

## CO-OPERATING WITH THE COMPUTER

A large number of *Battlefront* scenarios will be played solitaire. Unless you are trying to simulate particularly queer battles, you should be able to manage a decent solitaire playability.

We have already discussed how terrain choices can control the course of a battle. The first choice is actually the location of the terrain. You will have noticed how the Americans in Guadalcanal suffer from their restricted beach-head. The map edge will perform the same restrictive function. A division in *Battlefront* likes a depth of about eight hexes in which to operate unhindered. It should not be deprived of this room to manoeuvre without good cause.

The location and arrival times of HQ's are important. The location of a HQ determines the axis of communications and supply for your regiments. Units will move along this axis to go into reserve, and routers will more or less try to achieve the same thing. HQ's will

try to stay away from the edge of the map and from enemy forces. Unless you have a very good reason otherwise, you should make these tasks as easy as possible.

Supply is the other major function for HQ's. Avoid situations where HQ's get trapped by terrain features, putting their units out of supply. On the other hand, delaying the arrival of a HQ can often solve a number of problems. Without a HQ, units are out of supply and far less likely to get too aggressive. This can often be necessary where elements of a division straggle onto the map over a number of turns. The first units need to be there, but have to be restrained for a period of time.

Another way to hold back units is to have them start the game fatigued. The Argentine units in the Task Force South scenario are meant to wait for the British to arrive and start beating them up. Unfortunately, it is hard for the *Battlefront* system to reflect the total passivity of the Argentine High Command. The Argies used to leave their excellent defensive terrain and pour forth to meet the British, hastening their own demise even further. Having them start the game tired soon cured them of this habit, and they now wait patiently to be attacked. Of course units can also be created with fatigue to reflect combat prior to the start of the scenario.

There are two major factors which motivate the computer, the Victory Points derived from Objective Hexes and the location of enemy units. Each turn the computer calculates the Victory Points as they would be if the game ended then. These are also displayed for your benefit. The computer uses this as a guide to its progress in the game. If it is well behind, then it is more likely to be aggressive to try and make up the deficit.

However, this is only one input to the decision making process. Nevertheless, the choice of Objective Hexes and the VP's associated with them are critical. (Probably you knew this). It should be possible, by choosing correct start and end times, and adjusting the points per turn and end of game points to more or less lead the computer by the nose. You may be reassured to note that with any given scenario and its desired behaviour, there are multiple hex/VP solutions.

One thing that we may have neglected to tell you will help. If the game is running in OBSERVE mode then pressing the (esc/f1) key while the game displays the 'running'

message will cause the game to halt at the end of the turn. Orders and status of units can then be checked mid-game.

The other stimulus is harder to control. It is an integral part of the *Battlefront* system that all units usually want to get to grips with the bad guys. This reflects our belief in the the difficulties of ignoring uncommitted enemy forces. This occasionally leads to difficulties as units ignore their objectives and pile into the bad guys, who may already be being dealt with by other units.

If this is the case you will have to deal with it. Perhaps the bad guys are destined to be killed soon and their removal will free things up, in which case a slight elasticity with time and victory conditions may achieve the same effect. Maybe a closer point can be made into the vital hex in VP terms with the historical point being included but no longer vital.

Zero movement point units, representing flak units or garrison troops can act as bait. Objective hexes are sometimes necessary simply as navigational beacons. Do not put objective hexes too close to reinforcement hexes, unless you really want the units trying to get on to be chewed up or delayed forever.

## CO-OPERATE WITH YOURSELF

The test of a *Battlefront* scenario is how closely it simulates a chosen piece of military history. It is usually no trouble to simulate the final result of any engagement. With *Battlefront* we have tried to go further and simulate some of the processes involved in reaching that result. This is why we have placed such emphasis on conditions like supply and fatigue, and why we restrict command and manoeuvre decisions. We are trying to place you under the same constraints, and to give you the same sort of military choices as the original combatants.

The overriding test of any scenario creation then becomes whether it agrees with this philosophy. Numbers for parameters like strength or rating are not as important as how those troops are employed, and what choices are open to them. The perfect OB does not guarantee a perfect scenario. A map is only there to reflect ground conditions, as they affected the fighting.

Co-operate with yourself. Do the best you can on the little numbers, but concentrate on the big picture. ♦

# LEYTE GULF

## The Last Battle

22nd - 27th October, 1944

### A SCENARIO FOR CARRIERS AT WAR

By Kenneth G. Wastrack

*Twenty-nine months after the fall of Corregidor, MacArthur's promise to return to the Philippines became a reality. The fall of the Philippines would split the Japanese Empire in two and sever Japan's sea lanes with the Southern Resource Area. With oil resources cut off from the factories and repair yards of Japan, the Imperial fleet would become impotent. In one last, desperate attempt to stave off disaster, virtually the entire Navy was committed to. . . the final battle.*

#### THE SITUATION

The capture of the Marianas Islands in mid-1944 breached the main defense perimeter of the Japanese Empire and placed the home islands within range of long-range bombers. The Allies now adopted a strategy of blockade to cut enemy sea communications until the defeat of Germany freed sufficient ground troops for a direct invasion of Japan. The first landing on Leyte (on the western side of Leyte Gulf) would provide a staging

area for the main assault on Luzon. The original plan called for a preliminary invasion of Mindanao to obtain bases for land-based air support, however, pre-invasion raids by Third Fleet (Halsey) encountered weak air opposition, so the Mindanao invasion was cancelled. Air support for the Leyte invasion was provided almost entirely by carrier-based aircraft until air bases were established on Leyte. The invasion itself was covered by Seventh Fleet (Kincaid); including six old battleships (five of which had been at Pearl Harbour on December 7, 1941) for

gunfire support and a number of escort carriers for close air support. Third Fleet, with its fast carriers and battleships, provided distant air cover and watched for the approach of enemy fleet units.

The Japanese Navy had developed a series of plans to respond to possible Allied invasions of key areas in the Empire. The Battle of the Philippine Sea (during the Marianas campaign) effectively destroyed Japanese carrier-based airpower, so the Japanese carrier force (Ozawa) would become a decoy to attract Third Fleet away from the invasion zone. The still strong Japanese battleship/cruiser forces (Kurita, Nishamura and Shima) would fall on the Seventh Fleet and do as much damage as possible to the Allied transport and support forces. The desperation of the Japanese plan to get into Leyte Gulf is emphasized by the lack of any real provisions for getting back out again in the face of the Third Fleet (which was sure to respond with a vengeance). However, the cost was acceptable to the Japanese because a failure to act would quickly result in an immobilized fleet. Had the plan succeeded, future Allied invasions could have been delayed for months until the lost amphibious shipping was replaced.

On October 23, 1944, the Battle of Leyte Gulf opened when two U.S. submarines sighted the main Japanese battleship force west of the Philippines. After warning the the forces covering the invasion, the submarines sank two heavy cruisers and disabled a third. The next day, Third Fleet

The cover painting by Mitch Lovett shows 3 SB2C Helldivers from VB-7 (aboard the USS Hancock) peeling over to begin an attack on a Japanese aircraft carrier, probably the Chiyoda, in the Battle of Leyte Gulf.

search planes sighted this battleship ("centre") force heading for San Bernadino Strait (off the southeast end of Luzon) and the smaller battleship/cruiser ("southern") force bound for Surigao Strait (between Mindanao and Leyte). The carrier ("northern") force coming from Japan was not yet sighted. The main battle was about to begin.

On October 24, Third Fleet had only three of its four carrier task groups available; the strongest group, several hundred miles to the east for replenishment, was en route toward the battle area. Even so, Third Fleet was able to launch numerous air attacks against the centre force. One battleship was sunk and several other ships were damaged before the centre force reversed course toward the west. Simultaneously, Japanese land-based air attacks against Third Fleet managed to sink one American light carrier, but inflicted little other damage.

While this was going on, American search planes sighted the northern force. Since the Seventh Fleet was more than adequate to handle the southern force, and since pilot reports indicated the centre force was badly damaged and in retreat, the entire Third Fleet moved northward to destroy the Japanese carriers. Because of misunderstood communications, Seventh Fleet incorrectly thought a major part of Third Fleet was still watching San Bernadino Strait. The northern force had fulfilled its decoy role.

Seventh Fleet, thinking that Third Fleet was covering all northern approaches to Leyte

- Manila - 24 Oscar, 12 Peggy, 12 Sally
- Bacolod - 12 Tony, 12 Grace
- Malay'ay - 12 Tony, 12 Grace

## Continued from p.6

Gulf, turned its full attention towards the southern force attempting to penetrate Surigao Strait into Leyte Gulf. During the night of October 24-25, the southern force was overwhelmed in a textbook battle that was the last surface action ever fought between battleships. The Japanese lost two battleships, one heavy cruiser and three destroyers; the Americans had lost nothing larger than a PT boat. Seventh Fleet had destroyed the southern force; Third Fleet was about to destroy the northern force. Everything seemed secure.

As October 25 dawned, a small escort carrier group from Seventh Fleet with the radio call-sign 'Taffy 3', was operating east of Leyte Gulf to provide close air support for the ground forces on Leyte. Suddenly, a force of Japanese combat ships was detected on the horizon; it was the centre force which had reversed course again, passed through the unguarded San Bernadino Strait, and was now only a short distance from Leyte Gulf. Taffy 3, consisting of only six escort carriers and seven destroyers/destroyer escorts, was all that stood between the invasion forces and a Japanese force of four battleships, eight cruisers and eleven destroyers. The most dramatic phase of the Battle for Leyte Gulf had begun.

In a desperate two-and-a-half hour battle, Taffy 3 and its companion escort carrier groups fought back against the Japanese forces. The Japanese, thinking they were fighting the main combat elements did not know their plan was close to success. Confused and without accurate information about the location of American forces, the centre force turned back towards San Bernadino Strait, first to regroup before a new attack and eventually to retreat for good.

American losses in the battle were one escort carrier, two destroyers and one destroyer escort sunk compared with three Japanese heavy cruisers sunk. One additional escort carrier was sunk in the first kamikaze air attack of the war.

While Taffy 3 was fighting for its life, Third Fleet was beginning the expected destruction of the northern force. However, shortly after the first air strike was launched, Third Fleet received word of the battle being waged between centre force and Taffy 3. After a number of frantic requests for help, the fast battleships turned south toward Leyte Gulf, leaving only a part of Third Fleet to face the northern force. The result was a partial victory; four Japanese aircraft carriers were sunk, but the bulk of the northern force escaped. Meanwhile, the centre force reached San Bernadino Strait a couple of hours ahead of the Third Fleet battleships and also escaped, except for a straggling destroyer that was easily sunk. Allied air attacks claimed more Japanese ships in the days that followed.

The final tally was 28 Japanese ships lost compared to only six American ships sunk;

unquestionably a major victory for the Allied navies.

The Battle for Leyte Gulf was the biggest naval battle of modern times with nearly 300 ships involved at one point or another. The Japanese Navy suffered a major defeat and never posed a major threat for the rest of the war. However, the difference between defeat and victory was small; different decisions at critical points in the battle could have changed the course of history.

## THE SCENARIO

This scenario covers the period when the main portions of the battle took place. The American forces start on the map except for one Third Fleet task group that arrives on October 25. All Japanese units arrive on October 23. Between October 22 and October 27, the Japanese battleships must avoid the American fast carrier forces and reach their destination in Leyte Gulf,

slaughter the invasion forces and, if possible, escape. Some adjustments were necessary to achieve a playable game that is faithful to history. These included.

1. Representing two historical escort carriers as one aircraft carrier (Taffy 1.1, Taffy 1.2, Taffy 2.1 etc.) to fit within the system limit of 31 total carriers.
2. Abstractly representing ships that did not have a major impact on the battle - 8

**NOTE** - The shortage of seaplanes aboard Japanese capital ships in this scenario is due the squadron limit. However, Japanese bases, coastwatchers and an abundance of land-based search planes more than compensate for this shortfall.

APA and 8 AP class ships with slightly stronger defensive values to represent the much larger number of vessels actually present in Leyte Gulf.

3. Setting the Seventh Fleet command task group (TG 13) to a speed of 0 (AGC ship speed) to maintain the Seventh Fleet historical role of protecting the forces in Leyte Gulf.

The key thing that must be recognized in playing this game is the victory conditions (see below). The Japanese were willing to

Continued from p.10

pay any price to destroy the Allied invasion. Therefore, the victory conditions allow a Japanese victory, regardless of the Allied score. The requirement to sink or remove a specific number of auxiliary ships represents the impact on the Allied invasion forces. To win, the Allies must inflict a significant quantity of damage on the Japanese, but this must be accomplished without incurring excessive losses.

## VICTORY

**Allied Decisive** - 500 points more than the Japanese, less than 5 Allied auxiliaries (in TG 13) sunk or removed, AND none of the Japanese victory conditions are accomplished.

**Allied Major** - 500 points more than the Japanese AND none of the Japanese victory conditions are accomplished.

**Allied Minor** - More points than the Japanese and none of the Japanese victory conditions are accomplished.

**Note.** An Allied Minor Victory approximates the historical outcome and should be considered a draw for game purposes.

**Japanese Minor** - More points than Allied.

**Japanese Major** - 500 points (regardless of Allied score) or at least 8 Allied auxiliaries (in TG 13) sunk or removed.

**Japanese Decisive** - 500 points (regardless of Allied score) and at least 8 Allied auxiliaries (in TG 13) sunk or removed.

The following interpretations apply to the victory conditions.

**Minor Victory** - No significant change has occurred in the course of the war, either in strategy or in the ultimate timing of the war's completion.

**Major Victory** - The course of the war has been greatly altered. An Allied victory leads to a quicker end to the war as the schedule of future invasions is accelerated, while a Japanese victory forces significant delays in the Allied plans.

**Decisive Victory** - The course of the war has not only been greatly altered, but political repercussions force major changes in the conduct of the war. An Allied victory results in a more moderate Japanese government coming to power, and taking a serious look at ending the war. A Japanese victory results in major shakeups in the Allied leadership in the Pacific theatre as the end of the war appears further away than ever.

## SOME VARIATIONS

**1. Joint Command.** Historically, both sides consisted of split commands, so opportunities were missed and major disasters occurred. Had forces been combined, victory could have been greater, or losses less disastrous. Combine all task groups into fewer task forces on one or both sides.

**2. Trained Aircrews.** The Japanese were desperately short of quality pilots, due to combat losses and inadequate time to train replacements. If the invasion had been a few months later, or the Japanese had established a better training program, aircrews could have been more completely trained. Upgrade the combat experience of all Japanese squadrons by 1 or more levels.

**3. More Aircraft.** In the weeks preceding the battle, the Japanese suffered tremendous losses in aircraft, so the forces available to counter the invasion were woefully inadequate. Assume the Japanese had been more careful in committing their air power. Double or triple the strength of all combat (fighter and bomber) squadrons assigned to bases in the Philippines - Tuguegrao, Clark Field, Manila, Legaspi, Bacolod, Butuan, Malaybalay and Davao.

## SOME NOTES

**1. Reinforcements.** All the Japanese naval forces, and one of the Allied task groups, in this scenario begin the game as reinforcements. Remember that there is no control over these groups until they enter the map.

**2. Creating the Weather.** Weather forecasts are provided for each of the twelve sectors. Enter these via Menu 14 then go to Menu 13. Type (RET) five times to get

the weather report routines up and running, then save the result as the Weather Report.

**3. Prohibited Hexes and Blocked Hex-Sides.** A number of hexes must be designated as prohibited (terrain type T1) to prevent problems with naval force movement routines.

These hexes are 14:66 23:25 31:34 32:55 36:35 41:43 16:64 23:26 32:35 34:34 40:43 43:48 22:26 24:31 32:47 35:52 41:41 44:59

Two hex-sides are blocked because these channels were not navigable by naval forces in a combat situation. Blocking the hex-side prevents movement that would not have occurred historically.

These hex-sides are: 40:43/41:43 42:48/43:48

**4. Clearing Map Points.** This is just a reminder to type (Y) on the <CLEAR MAP POINTS> line. Otherwise, every coast-watcher will end up in hex location 0:0. Coastwatchers represent Allied guerilla forces and Japanese ground forces that might have observed enemy naval movements and relayed sighting reports.

### EDITOR'S NOTE

This scenario, designed by Kenneth G. Wastrack of Muscle Shoals, Alabama, was the winner of our *Carriers at War* design competition. Ken also wrote the historical notes accompanying the scenario.

# PROGRAMMING AND GAME DESIGN

By Roger Keating and His Computer

*Before you start a strategy game you have to decide on how the game is going to be displayed to the players. In almost all cases a grid system has to be developed that will do three things: regulate movement, allow for the easy resolution of combat and give the computer's intelligence something to bite (sic) on.*

*The method that I have used in all games to date is the hex grid system, a system that has been used in traditional board wargames for the last 25 years.*

## A NOTE ON NUMBERS

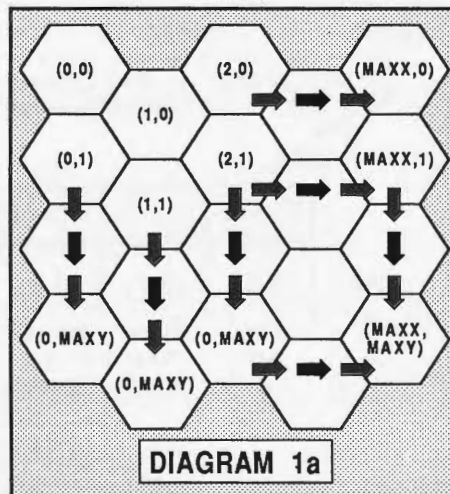

A small note before starting. Any number which is intended to be read as a decimal will have an exclamation mark in front of it (i.e. !10 means decimal ten). Machine language programmers use the exclamation mark to denote surprise at the fact that people still use this system! A hexadecimal number has a dollar sign attached (i.e. \$10 = !16). This is to indicate the vain hope of the programmer that he will be paid!

The hexgrid has several advantages over other grid forms, such as having 6 sides and 6 adjacent hexes to play with; i.e. you can move in 6 different directions. Unfortunately computers do not have the ability to display this type of grid easily but that is another story.

My problem has been to get this hex grid into a small amount of memory and build routines to access it rapidly. To demonstrate this process I will use the grid system from *Battlefront*.

## THE BASIC HEX

*Battlefront* uses a map size of !39 hexes across and !28 down. Through the creation routines it is possible to choose a smaller portion of this basic size to allow smaller battles to be fought out. For this purpose the map has been divided into 12 segments, 3

across and four down. The variables MAXX and MAXY are set to the maximum number of columns and rows respectively. The map system is labelled as shown in diagram 1a.

The values of MAXX and MAXY can be decided by reference to diagram 1b.

The Stalingrad scenario in *Battlefront* uses 1 screen across by 2 down therefore MAXX = !12 and MAXY = !13.

This means that !39 \* !28 (!1092) hexes are going to be stored in the *Battlefront* map database. I will use the co-ordinates (XC,YC) to mean the central hex that is being discussed and the directions 1 to 6 will be used to address the six adjacent hexes. See diagram 2a.

The variables that will have to be stored for the central hex and its 6 adjacent hexes are identified in diagram 2b.

Thus -

C0 = color of the central hex

C1 - C6 = type of sides surrounding the central hex

ST0 - ST6 = flags to identify features in the hex  
 T0 - T6 = natural terrain of hex  
 TX0 - TX6 = shape that 'occupies' the hex  
 DIS = flags to indicate if central hex is objective for either side.

## SETTING UP THE TERRAIN TABLE

To fit the data for the 1092 hexes into the APPLE II or C64 with their limited memory capabilities it was necessary to try to limit the number of bytes allocated to each hex. After much discussion about the size of each of the above variables it was decided to allocate 3 bytes to each hex in the map for a total of 13276 bytes. The variables are arranged in each of the 3 bytes as shown in diagram 3a.

Thus, for the town of BASTOGNE, the data in the 3 bytes would appear as shown in diagram 3b.

BASTOGNE is a town with a road through it and is under Allied control. Side 3 is a bridge and the natural terrain in the hex is clear (terrain #1). Both sides have objectives in this hex.

Note that C0 is not needed as the color of the central shape can be found from the terrain and C4, C5 and C6 can be found by looking at the C1, C2 and C3 values of the surrounding hexes as shown in diagram 3c.

Having decided to use 3 bytes per hex, it was a simple matter to allocate memory to it and devise a small subroutine (called ADDRESS) to access it. See diagram 4.

The map has been allocated to memory between \$4000 and \$4CCB. The space

DIAGRAM 3a

### T0 (terrain)

- |              |              |
|--------------|--------------|
| 0 - Ocean    | 8 - Airfield |
| 1 - Clear    | 9 - Shape 1  |
| 2 - Woods    | A - Shape 2  |
| 3 - Rough    | B - Shape 3  |
| 4 - Jungle   | C - Shape 4  |
| 5 - Mountain | D - Shape 5  |
| 6 - Swamp    | E - Shape 6  |
| 7 - Desert   | F - Shape 7  |

### C1-C3 (sides)

- |            |
|------------|
| 0 - Null   |
| 1 - River  |
| 2 - Bridge |
- DIS
- |                  |
|------------------|
| AL - Allied Obj. |
| AX - Axis Obj.   |

TX0 indicates the unit shape to be displayed; for example an Allied landing craft is \$15, a mechanized infantry unit is \$22. There are 155 different shapes.

DIAGRAM 3b

The data for the town of Bastogne.

DIAGRAM 3c

## SETTING UP THE INDEXES

To save the computer having to perform calculations for each hexside of an adjacent hex it is preferable to set up index tables

Continued on p.22

that will allow the computer to look at each in turn but use the same subroutine. This table can be set up by looking at the relative position of each adjacent hex compared to the central hex. See diagram 5a.

**DIAGRAM 5a**

It can be seen from diagram 5a that two index tables will be required depending on whether the XC value is even or odd. This is due to the way in which a row of hexes is drawn across a map. By moving 3 bytes back or forward the hexes in direction 1 and 4 can be examined and as each column is !28 hexes

long and each hex occupies 3 bytes it takes !28 \* 3 or !84 bytes (\$54) to get to the hex in the next row.

It is hard to have a simple index table with both positive and negative numbers in it so I decided to reference all the hexes from a point 1 column back and 2 hexes up from the central hex as shown in diagram 5b.

**DIAGRAM 5b**

To get to the new reference point I only have to subtract \$5A from the (XC, YC) position and from there I can then index each adjacent hex. For an even hex the table would be -

Direction 1 (add \$57), Dir 2 (add \$AB), Dir 3 (add \$AE), Dir 4 (add \$5D), Dir 5 (\$06), Dir 6 (add \$03).

This is tabulated in the subroutine BREAKHEX and called HEXIND. In HEXIND, there are in fact two additional indexes. They are used when the hex (XC, YC) is in the top row or the bottom row. They allow the computer to know when the adjacent hexes are outside the map. If an even hex is in the top row then hexes in directions 1,2 and 6 are off the map and if in the bottom hex row then direction 4 will be off the map.

For the top row -  
Direction 1 (-), Dir 2 (-), Dir 3 (add \$AE), Dir 4 (add \$5D), Dir 5 (\$06), Dir 6 (-).

For the bottom row -  
Direction 1 (add \$57), Dir 2 (add \$AB), Dir 3 (add \$AE), Dir 4 (-), Dir 5 (\$06), Dir 6 (add \$03).

**THE CODING**

ADDRESS and BREAKHEX are the subroutines that locate a hex in memory and reassemble the data into a usable form. They

## **A SCENARIO FOR BATTLEFRONT**

**By Gregor Whiley**

*Planning for Operation Market-Garden started on the 10th of September, 1944 when Field Marshall Montgomery received Eisenhower's permission for a daring air and ground operation to seize a bridgehead over the Rhine. One week later, the most ambitious Allied airborne operation of the war began. Within a further week, it was a total failure. The British 1st Airborne Division was virtually destroyed by the remnants of two SS Panzer divisions (in the area for refit) and the Rhine crossing at Arnhem remained in German hands. It was to do so until April 1945.*

### **THE SITUATION**

As the Germans retreated in disorder through France it seemed that nothing could stop an early end to the war. In fact, the Germans were retreating faster than the Allies could advance. The Channel ports had been bypassed in the headlong advance and were still held by their garrisons. All supplies for the Allies still came by truck from the Normandy beach-head.

In the inevitable supply shortages that followed, it seemed that the only barrier to further advance was logistical. The greatest enemy for a commander was not the Germans but other Allied commanders, all grabbing for a share of the supply cake.

Montgomery, now in command of the 21st Army Group fighting in the north favoured, as did the British generally, a single concentrated thrust at the Germans, the 'narrow front'. He, of course, would do the advancing. Eisenhower and the rest of the Americans favoured a continual advance on a 'broad front'.

This fundamental conflict of ideas continued throughout the operations on the Western Front. Moreover, the stunning success of Patton's Third Army had produced a military/political climate which would have made it hard for Eisenhower to give Montgomery what he wanted in any case.

Meanwhile, the Allied enthusiasm for Airborne operations had produced the First Allied

Airborne Army. It contained six divisions and over 1500 transport aircraft plus gliders. The speed of the advance had meant that since D-Day, no operations had been possible. A total of 18 separate plans had been prepared and cancelled when the Germans were unsporting enough to retreat before they could be implemented.

This was a large force (one sixth of the total Allied strength) to have sitting around doing basically nothing. The Air Force wanted the pilots for the bomber offensive. The European commanders wanted air supply to help continue the advance. It was adding up to a *use it or lose it* situation.

Montgomery's plan was thus expedient for a number of reasons. His stated aim was to bottle the Germans in Holland and render the approaches to Antwerp safe. His ultimate aim was to break through to the Ruhr and thrust towards Berlin. This way he could not be denied the supplies necessary to finish the job. For Eisenhower, it offered a use for his airborne troops.

Moreover, it was undeniably true that if a narrow front breakthrough were to be made then the North was the best place, if the difficult terrain of Holland could be negotiated and Antwerp was usable as a port.

Monty's plan was to use three airborne divisions to seize and hold the river and canal crossings between the Meuse-Escaut Canal where the British XXX Corps had gained a

## Continued from p.23

bridgehead and the Rhine at Arnhem. The US101st Airborne division was to capture bridges between Eindhoven and Veghel. The American 82nd Airborne was to capture the major river crossings at Grave and Nijmegen. The British 1st Airborne was at the end of the line, the bridges over the Rhine at Arnhem, sixty four miles away.

In two days, the XXX Corps troops, led by the Guards Armoured Division was to link up with each airborne division in turn, until they reached Arnhem.

Planning for this operation was, of necessity, rushed. The haste was necessary to exploit the imagined parlous state of the Germans: A number of critical decisions had to be made with no chance in the limited time available of changing them.

Critical decisions in this category included disregarding intelligence reports of German tanks, deciding to make only one airlift on the first day and positioning the drop zones a long way from the actual objectives.

The airdrop at Arnhem was perfectly performed and all elements landed with negligible opposition. Since a whole brigade was to be landed the next day, the 1st Airlanding Brigade had to stay behind and guard the drop zones. This left 1 Parachute Brigade and the divisional troops to strike out for the bridge.

They were not to get very far. Determined resistance initially from the 16th SS Training Battalion, and then from troops from the 9th SS Panzer Division held up most of the regiment well short of the Bridge. Portions of the 2nd Battalion, moving through the night, made it as far as the north end of the road bridge and set up shop. They were cut off from the rest of their regiment and the Germans held the southern end.

The situation on the second day, the last day on which the British might realistically have hoped to retrieve the situation, was not good. Radio communications had almost totally broken down.

This forced Urquhart, the divisional commander, to go into Arnhem itself to try to find out what was going on. He had been caught up in the fighting (personally despatching one German with his revolver) and was totally out of touch. Lathbury,

commander of 1 Parachute Brigade was in a similar situation.

Moreover, close support air missions had been prohibited when transport aircraft were close to the target area. Given that the 1st Airborne lift was to extend over three days and that air liaison communications were as poor as the rest, not much could be expected in the way of air support.

The newly landed 4 Parachute Brigade was pressed into the attack. Over the next two days the rest of the division would try to force its way through to the 500 men holding out at the bridge. They would make little progress and take a lot of casualties.

Increasing German pressure was to turn the fight to reach the bridge into a fight for survival. Rescue, in the form of the arrival of XXX Corps, was remote. The division was hemmed into a small bridgehead around Oosterbeek. Attempts to reinforce this position with the Polish Brigade which landed south of the Rhine at Driel were unsuccessful. On the evening of the ninth day some 2398 officers and men of the 1st Airborne Division were evacuated across the Rhine. Left behind were 1400 dead and 6000 prisoners.

Operation Market-Garden was a failure. If the bridge over the Rhine was not captured then the expenditure of all those lives and resources was a complete waste. It is debatable as to whether the plan itself was militarily feasible. Even if it was, the ludicrously short period available for planning virtually guaranteed that things would go seriously wrong. They did.

## THE SCENARIO

The scenario lasts for four days and covers the initial landing and fight for the bridge. After four days the men defending the bridge had been defeated and the rest of the 1st Airborne had given up all hope of reaching it.

The Rhine has been depicted as a one-hex wide river. That way nobody gets across except at a bridge. There are two special land hexes representing damaged and undamaged bridges respectively. The damaged bridge hex depicts the railway bridge which was blown by the Germans just as the British got to it.

There is also a ferry hex. The ferry at Driel was working for the first three days of the battle but the British ignored it.

## SOME VARIATIONS

1. Two lifts on the first day. This was technically quite possible and should have been done. Advance the arrival turns of all day two arrivals to turn 3 on day 1. Remove the German GRS battalion which is there to persuade the 1AL to guard the drop zone as they were supposed to.

2. Proper use of the Polish Brigade. The Polish Brigade were scheduled to drop just south of Arnhem on the 3rd day. Due to bad weather and the fact that the Germans owned the drop zone they were dropped southwest of Oosterbeek on the fifth day, from where they failed to materially influence the battle. For this reason they are not represented in the original scenario.

3. If the British player holds Arnhem Bridge, then the Poles could be dropped as intended south of the city. Otherwise, they can be dropped on any original DZ still controlled by the British or around Driel where they ended up. They can be used from Day 3, or Day 2 if the British do a double lift.

4. The Ferry. The British controlled a working ferry at Heavadorp for three days without ever using it. Replace the ocean hex at (16,17) with the ferry hex type already defined in the terrain list.

5. XXX Corps to the rescue. The OB list for the Poles also lists three regiments and two assets from the Guards Armoured Division. They can be thought of as the XXX Corps advance elements. If the British held the Arnhem Bridge and if the 82nd Airborne had captured the Nijmegen Bridge they could have arrived after about three days. As it was they were stopped south of Arnhem by troops of the 10th SS Panzer Division who were able to use the recaptured Arnhem bridge. To activate those units with a bracketed combat strength on the OB, alter the strength value from 0 to that shown in the brackets.

6. Better Air Support. Poor planning and worse communications meant that the total Allied Air Superiority counted for nothing on the ground. Since ground support techniques had worked in Normandy, they could have been made to work here. Give the Allies at least 25 Air Support points. More if you actually want to win as the British.

7. Extended Scenario. Change the game length from 4 to 7. The British will need some help, however, to avoid total destruction. ♦

# PATTON VS ROMMEL

## A review of Chris Crawford's latest game

*Chris Crawford, the talented computer game designer who has authored such titles as **EASTERN FRONT:1941**, **LEGIONAIRE** and **BALANCE OF POWER** (reviewed in Issue 2 of Run 5), has released a new game based on Operation Cobra, the Allied breakthrough in July, 1944, west of St. Lo.*

Patton vs Rommel is a game depicting the final, successful attempt by the Allies to break out of the Normandy area, Operation Cobra. The game covers the period from July 25th to August 8th 1944, for one or two players, and represents divisional level units.

The game begins shortly after the Allied carpet bombing of the German line, and the Allies have two air force units at their command, 2TAC and 9TAC, weather permitting.

### PRESENTATION

The game comes in a square album cover with the manual in one sleeve and the disk tucked into a pouch inside. This is the way games should be packaged, bookshelf style. It is far superior to a box filled with padding and empty space. The cover is attractive and

includes a map on the back showing the entire game screen. There's a photo of Chris on the inside cover, but exactly what kind of tank is he reclining on?

The Manual looks great but one of its most enjoyable features is that you only have to read page 3, the Quick Start Overview, to play your first game. The Manual, as well as concisely detailing game mechanics and giving strategy hints, includes a summary of the history of the Cobra campaign and a synopsis of the personalities of General George S. Patton and Field Marshal Erwin Rommel.

One innovation of the game is its approach to cartography. There are no squares or hexes; you are presented with a geographically accurate map. Terrain is represented by light and dark patches, there are white, wiggly road networks and towns are represented by circles of a size related to importance. It looks great! See the accompanying illustration.

### PLAYING THE GAME

When you boot the disk you are presented with an image of Patton and Rommel glaring at each other from opposite sides of the screen. The object of the game is to make your commander smile and the other one frown. At this point you may select to play Allied or German sides solo against the computer or play a two player game. You may also select three levels of play: Beginner, Intermediate and Expert.

Once the game starts the map is set up. It all fits on the screen so there's no scrolling around, and you enter your first order session. There is one order session at midnight each day, and the game executes in 5 min increments, pausing to display combat events. During the day new orders may be issued from your command division to any divisions within its command radius. You just click the mouse, play is suspended and a flashing circle appears showing which units are close enough to order around. This also includes reassigning the air force units to any of the indicated divisions, but you cannot then give their support back to any units outside of your command radius.

Orders are given to units by activating them with a mouse click and then pointing at a number of map locations. The unit will move from point to point in the indicated sequence, blasting away at any enemy units that get in its zone of control. When combat occurs it is animated; a screaming arrow dives from attacker to defender with a whump sound as it hits and perhaps the crunch of breaking morale, resulting in either attacker or defender flinching away.

At the end of the day your supreme commander shows up, glaring out of the screen at you and pointing a finger, to give you some friendly advice. "Don't attack units frontally." yells Patton, "Why don't you allow your troops to rest before a big battle?" asks Rommel.

Don't expect any congratulations for doing things right, although if you play an exceptional game then Chris has provided a heartwarming surprise for you when the battle's over. The advice feature is useful for getting beginners off the ground but

<b>TITLE</b>	-	<b>Patton vs Rommel</b>
<b>AUTHOR</b>	-	<b>Chris Crawford</b>
<b>PUBLISHER</b>	-	<b>Electronic Arts</b> <b>1820 Gateway Drive,</b> <b>San Mateo, CA. 94404</b> <b>U.S.A.</b>
<b>FORMAT</b>	-	<b>Macintosh, 512K minimum</b>

<b>REVIEWED ON</b>	-	<b>Macintosh Plus</b>

becomes annoying once you know what you're doing.

Sound, combat animation and friendly advice are all optional. I usually play with the sound and advice off and keep the animation on to draw my attention to the conflicts.

When giving orders to units it is important to consider the unit's facing. You do more damage attacking an enemy unit's flank or rear, which is an unusual thing to find in a game with division sized units. It can be hard to take advantage of facing in the beginners' game since facing is determined entirely by direction of movement as a division cannot be made to wheel in place.

## LEVELS OF PLAY

The basic game merely allows movement orders and the assignment of air power. This is a fast and easy to learn game. The Intermediate level introduces attack, defence and movement modes, facing orders and a useful feature to instruct units to begin actions at a certain time. At this level you have a very stimulating strategy game with enough options to keep you happy through many battles.

The expert game is really the wargame construction set. At this level you may edit all the units and features in the game environment.

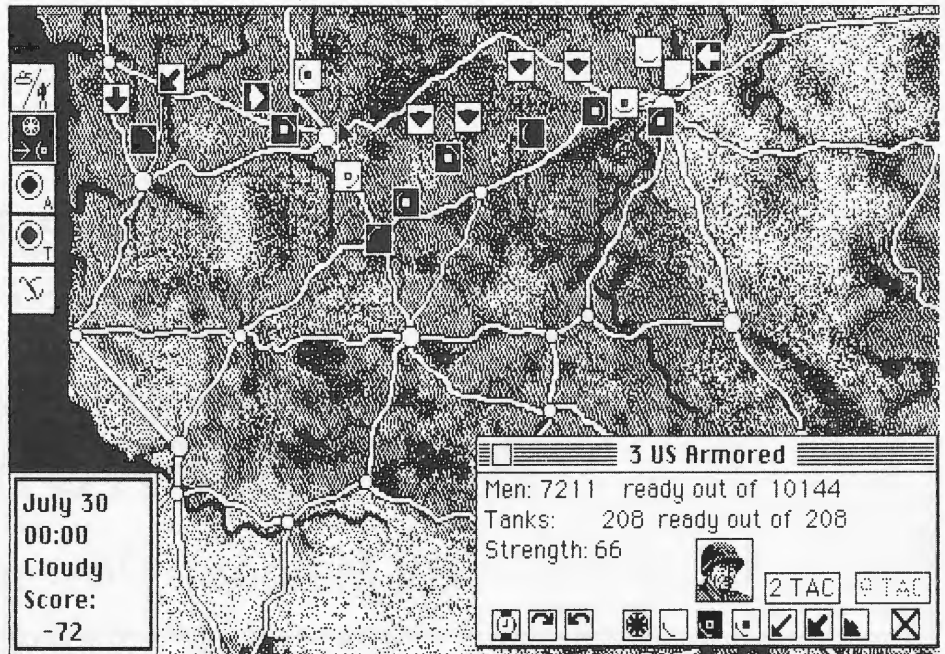

Two player games of Patton vs Rommel are best when played at intermediate level.

## WARGAME CONSTRUCTION SET

The important point to note is that you may not change the map and you cannot manipulate the weather. Apart from these, everything else may be altered. You may alter global variables that affect zone of control radius, airpower strength, the parameters for the various attack and defense modes etc. You may set up all the possible units with new starting locations, initial strength and time, reinforcement arrival times and so on.

All this is done after having started an Expert level game. You then save everything as a normal saved game. The construction set does not distinguish between a saved game and a scenario.

### Game Options EDIT

An intermediate level game in progress. The 3 US Armored Division is displayed and ready for orders. The icons on the left of the screen are used to select different display modes for the divisions; from top to bottom - unit type, unit facing, actual strength, total strength and morale.

## HISTORY AND SIMULATION

The first thing the manual explains is that neither Patton or Rommel were actually there! It then explains that they did have an effect on the command style on both sides so may be considered to have been there at least in spirit.

There is no consideration given to line of supply in this game, which may not be considered critical at this level of simulation for the time period covered, but would have tied up one of the problems with the way the game plays. Once there is a break in the lines, units from both sides can begin to run around claiming and reclaiming towns from one another in merry-go-round fashion. Units that have been crushed and end up routing behind friendly lines find it all too easy to reform to full strength and add to the confusion.

A further effect of this omission is that it becomes a disadvantage to surround enemy pieces. It is very difficult to wipe them out, especially playing against a computer player, and you must commit many divisions to containing the unit for a long period of time, even when its morale is cracked and its actual strength is very low.

Units are represented as a body count of men, artillery and tanks. No value is given to

the quality of troops and armament or to the efficiency of the unit's command and administration, factors that have been shown to be very important historically.

The method of mapping homogenises terrain effects. For example, there is no situation where infantry would fare better than mechanised units because the game system does not know specifically what type of terrain is involved.

When a unit flinches in a battle it forgets all orders and adopts a defensive mode. The units do not show any initiative in determining if it may be safe to proceed with their orders at any time. It might, then, have been a better reflection of the situation to allow more frequent order sessions or at least one other at midday.

## CONCLUSION

Patton vs Rommel is an enjoyable and fast paced strategy game. It is well presented and very good value for money. Although it does not rate strongly as a historical simulation it is a good introduction to strategy gaming and the criticisms are intended merely to be of use to serious simulation buffs.

I can recommend keeping an eye out for anything Chris Crawford does in the future and for this game right now. ◆

# ANZIO

## Bypassing the Gustav Line 22nd - 31st January, 1944

### A SCENARIO FOR BATTLEFRONT

By Malcolm Power

*From his sickbed in Tunis, Winston Churchill hatched the plan for 'Operation Shingle'. He became obsessed with the idea of a 'cat's claw' thrown behind the stalemate line in Italy. Intended as a quick way to break the deadlock, it envisaged a lightning strike from Anzio to cut German supply lines south-east of Rome, co-ordinated with an offensive by the Fifth Army against the Gustav Line at Cassino.*

*The landings could not have had a better start, achieving complete tactical surprise with no German units in the immediate vicinity.*

*All the ingredients were present for a stunning Allied victory. However, Anzio would develop into a bitter and protracted struggle. It would eventually lead Churchill, its creator, to lament "I had hoped that we would be hurling a wildcat ashore, but all we got was a stranded whale".*

#### THE SITUATION

The Anzio area, just 33 miles from Rome, 20 miles west of the Alban Hills and 70 miles north-west of Cassino appeared to be an

ideal location for an amphibious landing. In addition to being well within the range of fighter aircraft operating from the Naples area, it offered several useful topographical features.

Beaches suitable for landing craft existed both north and south of the town. The towns of Anzio and Nettuno offered sheltered harbours useful for resupply and landing operations.

To the north the landing area was bounded by good defensive terrain, consisting of a fissured labyrinth of wadis and gullies that made armoured movement all but impossible.

To the south the Mussolini Canal, a 170' wide irrigation channel with large embankments formed an almost purpose built anti-tank obstacle. Beyond this the Pontine marshes further hampered mechanised movement. This area, like the Anzio area itself, was reclaimed land crisscrossed by small irrigation ditches. The area south of the canal had been flooded by the Germans turning it into a marsh.

Just inland of Anzio the Padiglione woods provided useful cover for supply dumps and artillery. Beyond the woods, pastureland (dotted with newly built fascist farms) ran to the foothills of the Alban hills. These hills would later provide an excellent artillery position for the Germans, allowing any position in the Beach-head to be targeted. Railway and road embankments provided good defensive positions and allowed movement even after heavy rain had turned the reclaimed pasture land into a quagmire. The German supply-line to Anzio runs via Campoleone and Cisterna. Beyond Cisterna the main supply lines to Cassino ran along the Velletri (Highway 7) and Valmonte (Highway 6).

As Anzio is situated on the west coast of Italy, the assault would be launched from

Naples. Because Naples was controlled by the U.S. Army they would be in charge of the operation. Yet it was clear that the Americans had little faith in the operation as proposed by Churchill.

The British believed that the US Fifth and British Eighth Armies' offensives would draw German reserves (3rdPzGr Div and Hermann Goering Div) from the Rome area and that the landing in the rear of the German XIV Corps would cause it to withdraw in an attempt to contain the beach-head.

For their part the Americans believed that the Germans would react violently and call on all available reserves from Italy and beyond to contain the beach-head.

The British wanted to gamble at Anzio, however the Americans stood to lose the most should this gamble fail. With the Salerno disaster weighing heavily on his mind, Clark anticipated heavy resistance on the beach-head and intended the advance troops to go immediately on the defensive. The decision on whether to advance was left to the Corps Commander, General Lucas. Clark knew Lucas was not a man to take risks, no doubt the main reason for his appointment.

Lucas was certainly pessimistic about the operation as the following quotes from his diary indicate;

"I felt like a lamb being led to the slaughter" and "the whole affair has a strong odour of Gallipoli and apparently the same amateur was on the Coaches' bench".

Lucas planned to land his men as soon as possible and ensure that he had fifteen days supplies with ten days ammunition. Then and only then would he consider an advance.

The landing craft approached the beach without any preliminary bombardment. Complete tactical surprise was achieved and first news seemed to have reached German Headquarters via a German railway engineer corporal stationed at Anzio who dashed off on a motor cycle to raise the alarm.

The American 15th, 30th and 7th Infantry regiments quickly established a perimeter based on the Mussolini Canal. To the north the British 1st Division experienced trouble moving troops over the soft dunes but they pushed north to the Moletta River and by dusk recon units were five miles inland from Anzio along the Via Anziata.

The three Ranger battalions landed at Anzio were soon in possession of the port and it was cleared allowing its use by LST's and other craft by the afternoon of the 22nd.

Field Marshal Kesselring had kept two divisions in reserve near Rome (3rdPz Gr and Hermann Goering) to guard against possible Allied landings on the Tyrrhenian coast. However, when assured by his intelligence staff that an invasion could not take place for four to six weeks he decided on Jan 18 to commit these units to the X Army along the Garigliano. (The British diversion was working).

When news of the invasion first reached Kesselring in the early hours of the 22nd he wasted no time in employing his genius for improvisation. By 0500 all available local troops had been mobilised. Every artillery piece, including A.A. units, were thrown into an organised cordon around the beach-head. His two divisions were withdrawn from the X Army and O.K.W. plan 'Marder' was activated. This plan called for reinforcements from outside the Italian area to repel Allied amphibious landings. This reaction had been predicted earlier by American planners.

The beach-head line was stabilised along the Mussolini Canal through to the Flyover and on to the Moletta River. Lucas decided to consolidate his position, preparing for the inevitable German counter-attack.

For his part Kesselring was prepared to allow General Eberhard Von Mackensen to prepare his defences. Any extra delay by Lucas was gratefully accepted.

On Jan 24 the 5th Grenadier Guards advanced to Aprilia, a model farm settlement that was promptly dubbed 'the factory'. They displaced the 3rd PzGren defenders with support from Tanks of the 46 Royal Tank Rgt and the Irish Guards. A determined counter-attack was repulsed on the 26th.

Meanwhile patrols from the US 3rd Div were making little progress towards Cisterna. Gen. Truscot decided on a two pronged attack towards Cisterna; one via Crocetta with the 30th Rgt supported by tanks and tank destroyers from the 751st and 601st battalions; the other by the 15th Rgt along the Conca, Isola Bella, Cisterna axis. These attacks went in on the 25th but the 30th Rgt was stopped in its tracks by the Hermann Goering Div after making only four miles and the 15th Rgt made just one and a half miles. Further attempts by the 3rd Division on the 26th and 27th could get no closer to Cisterna.

By Jan 28 the British 24th Guards Brigade had managed to move only one and a half miles forward from 'the factory'. The "cats claw"

was getting stuck in the mud as persistent rain caused parts of the reclaimed land to revert to its original condition.

In spite of Allied air activity Kesselring succeeded in matching the Allied troop strength in the Anzio beach-head only one week after the landings commenced. Additionally, his heavy artillery could pound any area in the beach-head and German air raids were slowly increasing in intensity.

Gen Lucas was urged by Generals Alexander and Clark to take Cisterna and Campoleone. Both road centres provided equally good jump off points for Allied attacks out of the beach-head or German attacks into it. Coincidentally, the Germans were also massing reinforcements to mount a counter-attack.

The Allied plan called for the the US 3rd Div with the 504th Parachute Rgt and four Ranger battalions to attack Cisterna. This attack was to have three axes of advance. Firstly, the 1st and 3rd Rangers would infiltrate along the Pantano Ditch. This irrigation channel runs from the west branch of the Mussolini Canal roughly parallel to the Conca-Cisterna road which it joins approximately one and a half miles south of Cisterna. secondly the remaining Rangers and the 15th Rgt were to attack along the Conca-Cisterna road via Isola Bella, flanked on the left by the 7th Rgt. Finally the 504th Parachute Rgt was to protect the right flank by making a diversionary attack along the Mussolini Canal.

The main thrust was to be made by the British 1st Div on Jan 30 against Campoleone supported by the US 1st Arm Div which was to advance north west from Carreceto on the right flank. Phase 1 of this went well with the 24 Gds penetrating to about 1 mile south of Campoleone railway station. After spending an uncomfortable night under constant shellfire the Sherwood Forresters took up the advance, but failed to cross the railway line even after further support from the armoured units.

Meanwhile the American 1st arm Div was struggling to advance on the British right. Stiff opposition by German units allowed little advance and Gen Lucas called off this part of the offensive after Jan 30.

The American advance on Cisterna began with the 1st and 3rd Rangers moving up along the Pantano ditch. When they emerged just over a mile from Cisterna they were decimated by a well laid ambush that cut them off from support. The beleaguered Rangers defended desperately until their

ammunition ran out about midday. Only six men escaped being captured troops from the Hermann Goering Div. The relief columns were stopped by stubborn resistance from elements of the Hermann Goering Div. Little progress was made on Jan 30.

During Jan 31 Gen Truscot renewed his attacks and almost succeeded in reaching Cisterna. The advance stalled only 1 mile short of its objective.

The Allied position after both offensives had concluded was a precarious one. Neither of the main objectives had been taken, and a German counter-attack was expected. The men were ordered to dig in and hold until reinforcements withdrawn from other areas in Italy could reach them. (Anzio is now weakening the Allied front at Cassino).

The Allied front line consisted of two salients. One pointed at Cisterna and the other at Campoleone. The British position was by far the worst, the bulge here was four miles deep and only two miles wide, an ideal place for the German counter-attacks to concentrate.

Gen Von Mackensen's initial objective was to eliminate the British salient and then regain 'the factory' and Carreceto as a jump off point for the major offensive planned to eliminate the Allied beach-head. The initial objectives were taken by Feb 12 during stormy weather that kept most of the Allied Aircraft grounded except for an initial onslaught that pulverised the 3rd Pz Gren Div's communications so badly that the commencement of the offensive was delayed for one day.

With the initial objectives intact, the major German offensive, dubbed 'Operation Fischfang' commenced on Feb 16. The main thrust against Anzio was made by 31 battalions from various units. These attacks would concentrate along the Via Anziate in an attempt to drive through to Anzio itself. A diversionary attack was also to be made by the Hermann Goering Div against the American positions at Isola Bella.

The assault went in and encountered dogged resistance from Allied troops. By often using night attacks to minimise the effect of Allied air support the Germans succeeded in forcing a salient along the Via Anziate as far as the flyover. They threw units across the fields in a desperate attempt to make the final breakthrough. The Allies mobilised all reserves including cooks and storemen to stem the tide. The line held, and on Feb 19 at the insistence of Generals Truscot and Clark,

Lucas agreed to a counter-attack against the flank of the German salient.

This attack was made by the US 6th Arm Inf, 30th Rgt and a battalion of Shermans from the 1st Arm Rgt along the Padiglione-Carreceto road. Although heavy resistance from German Tiger tanks was initially encountered, the troops pushed forward. By 4 p.m. American units had taken 200 prisoners and penetrated to within two miles of Carreceto.

Hard fought local actions around the German salient continued as Allied and Axis units re-organised and brought forward reinforcements.

On Feb 29 the Germans attacked again in the Crocetta area. Little progress was made against the American 3rd Div's positions and Kesselring called off the attack on Mar 1.

Minor shifts in the front lines occurred as both sides stabilised their positions. A stalemate had developed and instead of Anzio breaking the Cassino deadlock, the Fifth and Eighth Armies' spring offensive launched on May 11 (4th Battle of Cassino), some three months later, would be the trigger to get things moving again.

The end result was far from that imagined by Winston Churchill when he originated the plan. The 'lightning strike' had resulted in a slow, costly advance. Eventually, the general withdrawal resulting from the Anzio breakout showed that the strategic basis for the landings was sound. If Gen. Lucas had been aggressive from the outset of the campaign, could this have occurred earlier?

## THE SCENARIO

This scenario simulates the period from the initial landings up to the time that the Allied offensives are stopped at Cisterna and Campoleone. Allied and Axis troop strengths are approximately even at this point, and the Germans have some units available that were used in the counter-offensive to follow.

To win the Allied player must take and hold either or both of their primary objectives and maintain a stable front. Good results on one flank only may expose vulnerable rear areas to a crushing German counter thrust.

The Germans must hold on grimly to each objective while also trying to preserve units

## Continued from p.38

for later offensive use. If the Axis player can take and hold Anzio or Nettuno for several turns he will win the game.

For both sides, maintaining a reserve is crucial. Uncontacted units can quickly seize an open objective or plug a hole when needed.

## SOME VARIATIONS

1. The invasion convoy was not spotted en route to Anzio by German air reconnaissance and German Agents in Naples did not reported the increased shipping movements in the port. Assume that German Intelligence was more *intelligent* and provided Kesselring with a warning of the impending invasion.

Advance the arrival of the listed units by the specified number of turns; 1/HG (4 turns), 2/HG (6 turns) and the 256 Inf (18 turns).

2. President Roosevelt delayed the departure of 56 LSTs from the Mediterranean to allow their use at Anzio. Additionally the Allies were extremely lucky to capture the Port of Anzio in such good condition. Assume the Port of Anzio is more extensively damaged and fewer LST's are available, therefore delaying supply buildup and the landing of armoured units.

Delay the arrival dates of the listed units by the specified number of turns; CCA (8 turns), CCC (10 turns) and the 179 RCT (8 turns).

3. Miserable weather conditions prevailed over the beach-head for periods throughout the campaign, beginning just two days after the landings. Without these periods of poor flying weather Allied air support would have been more effective. Assume better weather conditions prevailed.

Change the weather forecast from 3 (Building) to 5 (Stable).

4. Assume the Allied diversionary attack caused Kesselring to commit his reserve divisions earlier, thus delaying their arrival at Anzio.

Delay the arrival dates of the listed units by the specified number of turns; 104/200 (5 turns), 145 Inf (5 turns), 3rd PzGr XX HQ and assets (5 turns), 1/HG (7 turns) and 2/HG (3 turns).

5. The Allies mounted a concerted effort during the Anzio campaign to bomb out

German communications in order to delay the arrival of reinforcements. These measures proved to be surprisingly ineffective. Assume German reinforcements were significantly delayed by Allied bombing.

## Programming . . . Continued from p.22

can be accessed by machine language calls to \$800 and \$803 respectively.

To build your own map you must first write a create routine but if ADDRESS and BREAKHEX are understood this should not present a problem.

**Lines 64 - 91:** XCL and XCH are the low and high components of the address of each column. To find the address of the 7th column count along from XCL and you will find the value is \$F8. XCH gives the value \$41 therefore the seventh column starts in memory at location \$41F8. To that value must be added 3 times the YC value (as each hex occupies 3 bytes) and the result stored. The data for that hex can be accessed by;

```
ldy 00
lda (ML),y ; for the first byte
iny
lda (ML),y ; for the second
iny
lda (ML),y ; for the last
```

**Lines 96 - 113:** HEXIND is the table to allow for the easy breakdown of adjacent hexes. MINE and CITY are the respective shapes from the shape table to be used if the mine or city symbol is to be displayed on the screen. ROADFLG is set to indicate whether a road and/or fort is in the hex.

**Lines 120 - 127:** All the variables are first cleared to zero. Since BREAKHEX gives the terrain of all the adjacent hexes as well as the central hex, T1' through T6 must be cleared as well as T0.

**Lines 131 - 165:** The 3 bytes of the central hex are accessed and reassembled.

**Lines 170 - 210:** \$5A is now subtracted from ML/MH, the address of the central hex, and is stored in AL/AH. The appropriate line from HEXIND is calculated so that the correct adjacent hexes will be addressed. This represents a bit of 'self modifying code', i.e. the program itself is changed to address the correct data. This is not something to be encouraged but . . .

Delay the arrival dates of the listed units by the specified number of turns; 71st XX, except the 129 AA bn from the 1 Fshjr Rgt (4 turns), 1/HG (2 turns), 104/200 (2 turns) and the 145 Inf (3 turns). ◆

**Lines 212 - 268:** These lines sweep through all adjacent hexes and the relevant data is reassembled and stored. If an index of 00 is used the computer knows that the hex will be off map and T0 and TX0 is set at \$FF and ST0 is set to 0.

**Lines 270 - 299:** As well as the top and bottom, the sides of the map must be identified and the T0, TX0 and ST0 values of those hexes must be changed as above.

**Lines 302 - 327:** Edge of board and coast hexsides do not need to be entered through the creation routines. Coasts are put in wherever an ocean and land hex are adjacent. The edge of the board is easy to spot as the terrain of those hexes is negative (any number above \$80 is regarded as negative), so in line 304 the branch will be taken if the terrain is positive (bpl) and if negative the side is given the value 5 to indicate the map edge.

**Lines 331 - 365:** ROADFLG is set to indicate whether or not there is a road and/or fort in the hex. Also, by looking at the appropriate flags in ST0, a MINE or a CITY may be displayed. Finally TX0 is looked at to see if a 'foreign' shape is occupying the hex, and, if it is not zero, it is placed in the variable used to indicate the shape to be displayed (called SHAPE).

These routines have been slightly abridged from the original *Battlefront* routines but all the basic functions are there; i.e. the small amount of code that has been stripped out has nothing to do with this hex assembly.

All that is needed now is to address the high resolution screen and dump the appropriate shape onto the screen.

Actually, if you throw in a few creation routines, a bit of AI and a number of other bits and pieces you could have a fairly decent strategy game in which case we could be interested in publishing it. If, on the other hand, this feels like reading a Mongolian thesaurus then I would probably stick to playing the things and wait for self programming computers to become a reality (in which case I may be interested in a job somewhere).

I would like to thank John Smith for his help in writing this article. ◆

# SUPERIOR STRATEGY GAMES

## FOR YOUR COMPUTER FROM STRATEGIC STUDIES GROUP

### EUROPE ABLAZE

Available for the Apple II Family (64K) & C-64  
Suggested Retail \$50.00. Stock Nos 103(Apple) 203(C-64)

EUROPE ABLAZE is a complete game system designed to bring to life the vital struggle in the air which raged over Europe for almost five years.

Three major scenarios, selected from the various phases of the war, are presented to simulate the changing fortunes of battle as Britain, at first beleaguered by an overwhelming Luftwaffe, finally becomes the bastion from which American and British bombing forces wreak havoc upon the German war machine.

Each scenario offers up to six command positions per side, any or all of which may be computer controlled. The player takes the role of C in C (Air Forces) and/or up to five subordinate commands. The result is an entertaining and rewarding experience for either solitaire or group play.

Major bombing missions are planned twice per day (daylight ops at midnight, night ops at noon) and require target selection, course plotting, speed and H hour determination and finally squadron allocation. Other operations available to strike aircraft include harassment, raid, and recon missions.

Fighter aircraft perform intercept and patrol (both standing patrols and intruder patrols) ops in response to ground and radar sightings. These ops can be launched at any time.

Targets range from city centres (population, industry, communications and port facilities) to radar stations, airfields and shipping lanes.

And furthermore... we have provided the creative gamer and historian with a complete *game design kit*.

This exceptional tool will allow you to create your own scenario variants as well as designing original campaigns. To explain their use, the design routines are illustrated with an entirely new scenario recreating the operations of the US 15th Air Force from Italy in May 1944.

### CARRIERS AT WAR

Available for the Apple II Family (64K) and C-64  
Suggested Retail \$50.00 Stock Nos 102(Apple) 202(C-64)

"Besides its historical accuracy, *Carriers at War* is the best-playing simulation of naval warfare I have seen on either tabletop or video monitor."  
*Computer Gaming World.*

"*Carriers at War* is the best game available on World War II carrier operations. It is, perhaps, the best wargame of 1984 on any topic."  
*Your Computer.*

"In actual play, the computer is no more predictable than a human counterpart. It is capable of undertaking daring and risky manoeuvres, or it might play conservatively. You can never be sure."  
*Strategy & Tactics Magazine.*

"...it's an excellent game — playable, enjoyable and tense. Kudos to SSG, and I hope they continue producing products of this high level for others to try to emulate."  
*Commodore's POWER/PLAY.*

"The combination of excellent detail and an innovative, easy-to-learn game system makes *Carriers at War* one of the most attractive products currently available on the market."  
*Fire and Movement.*

"All in all, *Carriers at War* is one of the best computer wargames around, and is definitely the finest programming accomplishment in quite some time. You gotta get it!"  
*Winner of U.S.A.'s Charles Roberts Award for Best Computer Game 1984-1985, the first Australian Game to win this award.*

### REACH FOR THE STARS

Available for the Apple II Family & C-64  
Suggested Retail \$48.00. Stock Nos 101(Apple) 201(C-64)

"*Reach for the Stars*... is just about the best science fiction game for the thinking person available on any microcomputer."  
*Science Digest.*

"This is an interstellar strategy game... but that's like calling the Apple a 'nice computer'. It leaves a good deal out. Think of it this way: if *Wizardry* is a fantasy game and *Zaxxon* is an arcade game, then *Reach for the Stars* is a strategy game... In short, the game itself is beautifully designed. More than that, the 'engineering' of the thing is lovely. You can do just about anything you want to with the system, from adding various hazards to the game universe, to stopping a game in the middle and saving it on disc."  
*Softalk.*

"*Reach for the Stars* is a stimulating program."  
*Creative Computing.*

"*RFTS* is, after a little playing, a very user friendly game... (It) offers features to be found in no other space game. Its great artificial intelligence and careful design could only be expected after Roger Keating's many successful designs for SSI and Ian Trout's long hours of work in development. My only hope is that *RFTS* is soon followed by more games of the same quality."  
*Computer Gaming World.*

"...once mastered this might be the only game you'll ever want to buy for your C-64. Indeed, it would be worth buying a computer to play it. Definitely one of my most favourite games and a classic."  
*Commodore Magazine.*

"In summarizing, *RFTS* is an excellent game. It is fast and intelligent, and the game mechanics are simple but the strategy required is quite devious. Add to this the natural strengths of a game employing four people in subtle but all out competition and you have a winner."  
*Your Computer.*

# A Strange Woman Wants to Marry You.

An unknown man is trying to kill you. The State of Texas wants you for murder. But that's not your problem. Your real problem is...

## AMNESIA

It's a new text adventure that feels like a Hitchcock-style nightmare. You're lost on the streets of Manhattan with no money, no friends, no memory—and someone wants you dead. Somewhere in The City are the clues to your identity—and your survival. The hard part is finding them—and eliminating your problems before they eliminate you.

You are locked in a cell. It is bare and dark and smells of lives gone sour. The only light is a feeble fluorescent glow that slants in through the louvered grill on the iron door. You know the door is iron because you have been beating on it. Your hands are sore, and your right eye is swollen shut. You ache all over.

— Ask the guard for some food, thank him, then eat it and go to sleep.

A 1700-word vocabulary recognizes complicated commands in plain English.

It feels great to be a faceless, nameless atom among a million others churning about in the grid of Manhattan's streets.

It feels safe. As you approach Fifth Avenue, the brief buoyancy of feeling free gives way to ordinary now-what anxieties. You've got no money, no credit cards, nowhere to sleep, and no visible means of support.

— Beg for money, then enter the subway station.

It's Manhattan on four disk sides! Over 4000 locations to explore, including 650 streets and the entire Manhattan subway system.

**We think it's the best writing ever in a text adventure.**

It was written by award-winning novelist Thomas M. Disch—not a team of computer programmers. In addition to his 1980 Campbell Award for *On Wings of Song*, Disch's works have won major awards in England and Japan. The game's 300-page manuscript is the most ambitious ever in interactive fiction.

"A robust writer... a virtuoso." — *New York Times Book Review*

"...perhaps the most respected, least trusted, most envied... of all SF writers of the first rank: his reputation can only grow."

— *The Science Fiction Encyclopedia*

ELECTRONIC ARTS™

**How to order:** Visit your retailer. If you are unable to find the product at your local retailer, you can call 800-245-4525 for direct VISA or Mastercard orders (in CA call 800-562-1112). The price for direct purchases is \$44.95 for the Apple and IBM versions, \$39.95 for the Commodore version. To buy by mail, send check or money order to Electronic Arts Direct Sales, P.O. Box 7530, San Mateo, CA 94403. Add \$3 for shipping and handling (\$4 Canadian). Allow 4 weeks for delivery. There is a 14-day, money-back guarantee on direct orders. For a complete product catalog, send 50¢ and a stamped, self-addressed #10 envelope to Electronic Arts Catalog Offer, 1820 Gateway Drive, San Mateo, CA 94404.
